THE HEEREMA GROUP, THE NETHERLANDS

Key Facts
Company: The Heerema Group
Website: www.heerema.com
Country: The Netherlands
Products Used: Intergraph Spoolgen®

Key Benefits:
• Fast and easy creation of shop isometrics and enormous productivity gains
• Quick setup of projects, the addition of material data, and the creation of reports for other systems
• Easy extraction of data from IDF files that can then be output to drawings

INTERGRAPH SPOOLGEN® HELPS HEEREMA CONSTRUCT IN RECORD TIME

The family-owned Heerema Group was incorporated in 1948. The Heerema Group has developed itself since into an international player in the offshore oil and gas industry and the construction and infrastructure markets.

The Heerema Group consists of four autonomous entities that each provide specific input within the joint areas of the Group. The potential synergies and connections provide the Heerema Group with the people and resources to provide solutions for complex technical projects. The Heerema Group employs 2,100 personnel worldwide and has an average turnover of € 0.7 billion.

THE CHALLENGE

The Heerema Group, a Dutch construction company, is one of the leading construction companies working in the international oil and gas industry today. The company has four divisions – Heerema Marine Contractors, Dockwise, Intec Engineering, and Heerema Fabrication Group (HFG), which specializes in offshore fabrication. Heerema has been providing solutions for some of the world's most complex technical projects since it was founded in 1948.

HFG builds large, complex facilities for the oil and gas industry, such as offshore platforms, topsides, decks, and jackets. With three yards situated around the North Sea at Hartlepool in the U.K. and Vlissingen and Zwijndrecht in the Netherlands, HFG has the resources to construction facilities up to 10,000 tons in weight at any one time.

In any construction project, the accurate flow of fabrication data from the engineer to the fabricator is of vital importance. Inaccuracies can lead to significant project delays and expensive rework costs that can result in millions of dollars being spent over budget.

One of the key data sets for any fabrication project is the information relating to the piping systems that need to be constructed. Typically, the engineering contractor supplies this piping data in IDF or PCF files, which come directly from the 3D system
used to design the construction. The fabricator then adds the necessary fabrication and construction information and generates all the necessary spool drawings and reports for the workshop to construct the pipes.

“We invested in a software package to do this, but found it outdated,” said Herman Slot, ICT Manager at Heerema Zwijndrecht. “The vendor didn’t provide adequate technical support either. One major bug in the winter of 2002 caused our projects to be held up for a month while a fix was looked for. We simply couldn’t go on like that.”

THE PROJECT OBJECTIVES

• Assure accurate flow of fabrication data from the engineer to the fabricator
• Quickly and accurately construct project piping information data sets
• Take PCFs supplied by the EPC contractor, create spools, and add the required construction information
• Create shop isometrics easily to speed productivity

THE SOLUTION

In 2003, Heerema Zwijndrecht was awarded a major contract by Statoil to build the slug catcher and monoethylene glycol (MEG) facilities for a liquified natural gas (LNG) plant on Melkøya Island off the coast near Hammerfest in Norway. The plant converts gas piped ashore from the SnØhvit field deep beneath the east Barents Sea before being shipped by special gas carriers to Spain and the U.S.

Statoil stipulated that the slug catcher and MEG facility had to be delivered by the spring of 2004 to meet the construction schedule.

“We urgently needed a new software package that would take PCFs from Linde, the engineering, procurement, and construction (EPC) company contracted to the SnØhvit Project, and allow us to create spools and add the necessary construction information,” said Herman. “We analyzed the market, checked which packages our subcontractors and suppliers used, and finally created a short list of two alternatives.”

“One of our subcontractors had achieved efficient cost savings with Intergraph Spoolgen®, and there were also sufficiently experienced engineers who knew the tool and could deliver ISOs in the correct data format,” said Herman. “After a demonstration of Intergraph Spoolgen’s capabilities, our team felt confident it was the right tool for the job – a belief that has proved correct.”

The delivery of the first MEG module was scheduled for April 1, 2004, and it was delivered on time at Melkøya Island. By the end of July, the other three MEG modules and the slug catcher had been delivered from Heerema’s Zwijndrecht facility – totaling more than 15,000 tons of construction.

According to Statoil, record-fast delivery, on schedule and on budget, along with a good health, safety, and environmental record, were key features of the SnØhvit deliveries from Heerema. It stated that module deliveries of this type and on such a large scale had never before been carried out within such a short timetable.

Intergraph Spoolgen is now integral to Heerema’s fabrication business. The product is used in all of the company’s construction projects for the production of drawing shop isometrics and spools.

According to Willem Jan Pons, one of Heerema’s senior piping engineers, Intergraph Spoolgen enables the easy and fast creation of shop isometrics, resulting in enormous productivity gains. Herman concurred, saying, “Intergraph Spoolgen saves an enormous amount of time for shop engineering, and subsequently the cost savings are very significant, plus it’s very easy to use and the technical support we receive is excellent. Deciding to invest in Intergraph Spoolgen was an important step forward for Heerema.”

ABOUT HEXAGON

Hexagon is a global leader in digital solutions that create Autonomous Connected Ecosystems (ACE). Our industry-specific solutions create smart digital realities that improve productivity and quality across manufacturing, infrastructure, safety and mobility applications.

Hexagon’s PPM division empowers its clients to transform unstructured information into a smart digital asset to visualize, build and manage structures and facilities of all complexities, ensuring safe and efficient operation throughout the entire lifecycle.

Hexagon (Nasdaq Stockholm: HEXA B) has approximately 20,000 employees in 50 countries and net sales of approximately 3.8bn EUR. Learn more at hexagon.com and follow us @HexagonAB.
