IMAGINE Photogrammetry
A Complete Suite of Photogrammetric Production Tools
State-of-the-art Photogrammetric Production Tools

How do you consolidate multiple photogrammetry projects into a single, fast, manageable workflow? Is it possible to reach new levels of production throughput without compromising the detail and accuracy your customers expect or the functionality you have grown accustomed to? How do you handle photogrammetric projects with a variety of different data types and formats?

Today, photogrammetry and production mapping experts are under pressure to produce more in less time, while maintaining a rigorous degree of accuracy. Hexagon’s Geospatial division understands this challenge, and builds the tools to help you accomplish your goals on time, in scope, and to the preferred accuracy.

IMAGINE Photogrammetry, a seamlessly integrated collection of software tools, enables you to transform raw imagery into reliable data layers required for all digital mapping, raster processing, GIS raster analysis, and 3D visualization needs.
A fully functional photogrammetry system packaged in a user-friendly environment, IMAGINE Photogrammetry provides results for everyone, from photogrammetry novices through advanced users. State-of-the-art photogrammetry technology, such as full analytical triangulation, digital terrain model generation, orthophoto production, producing orthomosaics, and extracting 3D features, has been included in the easy-to-use environment. By automating precision measurement and including flexible operations such as terrain editing and feature extraction, IMAGINE Photogrammetry increases productivity while ensuring high accuracy. IMAGINE Photogrammetry is the most flexible photogrammetry solution on the market, handling a variety of workflows including:

- Triangulation and orthomosaic production
- Broad area mapping
- Transportation planning
- Engineering and facilities mapping
- Defense applications
- Close-range applications

Tight integration with ERDAS IMAGINE® means that this is the ideal photogrammetric package for projects involving varied types of data and further processing and analysis of airborne and satellite imagery. The added power of IMAGINE Advantage® is included with every IMAGINE Photogrammetry license, enabling you to go beyond the standard photogrammetric outputs and deliver value-added products to your customers.

Increase Your Productivity

IMAGINE Photogrammetry maximizes efficiency without compromising quality and accuracy. Designed specifically for ease of use, it frees users from the steep learning curve often associated with photogrammetric software.

The clean, intuitive interface makes it easy to learn and easy to use. The workflow-driven toolbar guides the process, giving you everything you need to execute a photogrammetric project from beginning to end. Data interoperability is never an issue with the extensive variety of input and output formats that are dynamically supported, including data from other leading photogrammetric software.

IMAGINE Photogrammetry helps you save time in other ways, too. A process-driven workflow that efficiently transforms imagery into reliable geospatial content is the key to increased productivity. From classic frame photography, large-format digital and pushbroom sensors, to practically any satellite sensor, IMAGINE Photogrammetry supports numerous workflows.

Triangulation

Tie imagery together and to ground reference points. Once images have been triangulated, additional data processing such as terrain extraction, terrain editing, orthorectification, and feature collection can be performed.

Automatic, Classic Point, and Stereo Point Measurement

Measure ground points in a variety of methods. Automatically determine the corresponding image positions of ground points appearing on multiple overlapping images, measure ground and image points in monoscopic single or pair-wise view modes, and measure ground and image points in single-image and multi-image monoscopic and stereo modes, supplemented by automatic point correlation.

Orthorectification

Orthophotos are the ideal reference image backdrop necessary for the creation and maintenance of geographic information contained within a GIS database. IMAGINE Photogrammetry creates orthophotos by minimizing the distortion inherent in imagery caused by sensor orientation, topographic relief displacement, and systematic errors associated with imagery, resulting in planimetrically correct images representing ground objects in their true, ‘real world’ X and Y positions.
Set up and manage photogrammetric projects with ease, including input and output of ground control, GPS data, triangulation data, imagery, vector data, scanned paper maps, and terrain files in a variety of popular formats. Comprehensive image viewing features such as drag and drop capabilities, reprojecting on-the-fly, opening multiple views and linking them, and applying image enhancements are provided. Calibrated cameras and lenses can be defined and saved, as well as interior orientation parameters.

Integrating IMAGINE Photogrammetry with the capabilities of ERDAS IMAGINE enables multiple workflows, including:

- Color balancing, mosaic, and compression
- Landcover mapping and terrain categorization
- Map composition, printing, and report generation
- Data conversion
- Feature capture and update
- Image processing and unsupervised classification

Streamlined and Accurate

We know how important accuracy is in the photogrammetry industry. Because of this, IMAGINE Photogrammetry uses state-of-the-art photogrammetric and image processing technology to fine-tune your data and report results.

IMAGINE Photogrammetry includes the ability to edit terrain and collect points in stereo, which saves time and increases accuracy. With the ability to have multiple stereo views open in a variety of viewing options — Stereo, Split Panel, Mono, and Tri-View (stereo and split-screen) — and the ability to operate in either fixed-cursor or fixed-image mode, IMAGINE Photogrammetry is flexible enough to let you be your most productive.

IMAGINE Photogrammetry is loaded with time-saving features like drag-and-drop images into the stereo views. Read a terrain model or use image matching to automatically place the cursor at the correct Z location, speeding up the collection process. Fast graphics rendering with on-the-fly resampling for subpixel cursor positioning and measurement mean that you can work quickly and accurately.
Expand Your Capabilities with Add-on Modules

Hexagon offers an array of add-ons that expand the core functionality of IMAGINE Photogrammetry, making your photogrammetry investment more versatile and productive.

IMAGINE DSM Extractor

IMAGINE DSM Extractor add-on module comes with two different automated terrain extraction engines with varying levels of accuracy, resolution, and speed. These are Sparse Matching and Semi-Global Matching.

Automatic Terrain Extraction (ATE), which is the sparse matching option, allows you to automatically extract terrain from projects made up of aerial frame, Leica ADS, digital, video and non-metric cameras, as well as satellite sensors with stereo capability (Pleiades, SPOT, QuickBird, WorldView, GeoEye, and more). Customizable Terrain extraction strategy parameters allow you to match the strategy to the terrain you are creating, maximizing the accuracy of your DSM (Digital Surface Model). Embedded quality assurance, quality control, and accuracy reporting tools enable you to quickly and easily assess the DSM for fine tuning the parameters or pinpoint locations for terrain editing later. Terrains can be created in a wide variety of formats, including ERDAS raster formats, LTFs, 3D shapefiles, or ASCII files.

IMAGINE DSM Extractor creates very dense Red-Green-Blue (RGB)-encoded point cloud outputs using Semi-Global Matching (SGM). SGM is an algorithm that uses pixelwise, mutual information (MI)-based matching cost and a smoothness constraint to generate dense disparity maps, from which surface models are generated. It supports all sensor and raster formats supported by IMAGINE Photogrammetry. Using this Semi-Global Matching algorithm not only creates an accurate dense point cloud with high-definition hard edges on rooftops, but it also RGB encodes or False-Color-Infrared (FCIR) encodes the point cloud output, combining for an image-like quality dataset. The method features a straightforward, user-friendly interface to facilitate image pair selection, specify processing parameters, and define your output options.

Batching and Distributed Processing

Increase throughput efficiency by running in multicore processing mode on a single computer system using ERDAS IMAGINE’s batch tool or by distributed processing across a network of computer systems using HTCondor.
IMAGINE Terrain Editor

Once you have extracted the terrain, make editing the output fast, easy, and accurate using IMAGINE Terrain Editor. Displaying the terrain graphics as dynamic contours, TINs, breaklines, and points superimposed on stereo imagery provides an excellent baseline for editing. Visualize the ground control points from your block file to provide even more quality control. Improve the accuracy of your terrain by importing shapefiles that define breaklines and geomorphic paths. Add, delete, or modify individual terrain points, or save time by utilizing the linear and polygon selection tools to modify large numbers of points at once.

Rapidly smooth, thin, bias, flatten, fit to surface, and interpolate selected areas in your data. To accelerate your editing, IMAGINE Terrain Editor also supports customizable motion devices for precise interactive cursor control and point collection.

Stereo Analyst® for ERDAS IMAGINE

Collect, interpret, and visualize 3D geographic information from imagery using Stereo Analyst for ERDAS IMAGINE. It also serves as a feature capture environment when added to IMAGINE Photogrammetry. Providing support for collecting both planimetric and volumetric features with textures, in 3D, Stereo Analyst for ERDAS IMAGINE also serves as an excellent quality assurance and quality control tool for photogrammetric data.

ORIMA

ORIMA provides sophisticated production photogrammetry software for block triangulation and analysis. Perform production-focused aerial triangulation for analog, digital frame, and Leica Geosystems ADS40 and ADS80 imagery with outstanding intuitive graphical diagnostic tools, support for GPS/IMU corrections, self-calibration, and boresighting.
IMAGINE Defense Productivity Module (Classified Usage Only)

IMAGINE Defense Productivity Module extends the already large suite of sensors and formats provided in IMAGINE Photogrammetry with support for NTM data in TFRD and NITF formats, including AMSD metadata and provides additional defense-oriented capabilities.

Interoperable Photogrammetric Modules

**PRO600** is a set of cartographic presentation tools to use within a Bentley® MicroStation® environment for large-scale digital mapping using stereo imagery, including signs, symbols, colors, line thickness, user-defined line types and forms. PRO600 also includes terrain-oriented tools for projects that require both feature and terrain data. Based on the same stereo viewing technology as the IMAGINE Photogrammetry platform, you can expect the same seamless, accurate stereo environment in PRO600.

**Stereo Analyst® for ArcGIS®**: Tightly integrated with ArcGIS® Stereo Analyst for ArcGIS enables stereo collection inside your GIS environment to which you are already accustomed. IMAGINE Photogrammetry can be used to produce oriented imagery and terrain data for use in Stereo Analyst for ArcGIS. Collect features and add or update attributions, as well as update existing feature datasets with 2D to 3D feature conversion tools.

Hexagon is a global leader in digital reality solutions, combining sensor, software and autonomous technologies. We are putting data to work to boost efficiency, productivity, quality and safety across industrial, manufacturing, infrastructure, public sector, and mobility applications. Our technologies are shaping production and people-related ecosystems to become increasingly connected and autonomous – ensuring a scalable, sustainable future.

Hexagon’s Safety, Infrastructure & Geospatial division improves the resilience and sustainability of the world’s critical services and infrastructure. Our solutions turn complex data about people, places and assets into meaningful information and capabilities for better, faster decision-making in public safety, utilities, defense, transportation and government.

Hexagon (Nasdaq Stockholm: HEXA B) has approximately 21,000 employees in 50 countries and net sales of approximately 3.8bn EUR. Learn more at hexagon.com and follow us @HexagonAB.
