

HxGN AgrOn FERTILISATION CONTROL

System that intelligently regulates and automates the application of agricultural lime and fertilisers, avoiding waste and failures. It even shows the coverage of the application area in real-time, during the operation. The product has a variable rate application system for two types of implements, conveyor and electric variable rate.

Understand how **AgrOn Fertilisation Control** works:

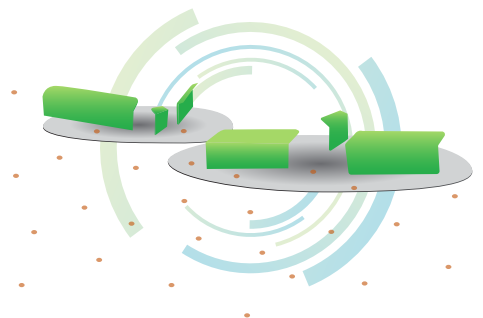

Learn more about AgrOn Fertilisation Control:

- Section shutoff on hydraulic motors
- Simple calibration and operation
- High precision controller
- Visualisation of application trails during operation
- Detailed operation information records
- Monitors and controls the application of up to three solid inputs
- Imports maps defined in the office
- Has the HxGN AgrOn Fertilisation Control | Remote access add-on module
- Applicable for any type of crop

The product also has the **Plate Rotation Control** functionality:

- Control the rotation of the fertiliser plates or disks that apply the product by broadcast. This product allows quick and easy configuration of the desired speed, as well as ensures that the speed reference is reached and monitored.

RESULTS AND BENEFITS

- Failure reduction during application
- Productivity increase
- Rationalisation of the use of inputs
- Equalisation of soil nutrients
- 15% reduction in fertiliser deviations
- Up to 25% reduction in inputs with variable rate controller
